

PR=1

1) What is Data Analysis?

→ It is a process of collecting, cleaning, transforming, exploring, and interpreting data to find useful informations and making better decision.

2) Planning a Data Science project.

→ It is planned systematically to solve a real-world problem using data.

* Steps :-

1) Problem Definition

2) Data Collecting

3) Data Understanding

4) Data cleaning

5) Exploratory Data Analysis

6) Feature Engineering

7) Feature selection

8) Model Building

9) Model Evaluation

10) Deployment

11) Monitoring

3) Machine Learning Problem statements?

→ Problem:-

The objective is to ~~predict~~ predict whether a customer will churn based on their purchase behavior.

* Target variable:

churn

- 0 → customer does not churn
- 1 → churns.

4) What are tensors?

→ A tensor is a multidimensional array used to store numerical data.

* Types of Tensors:-

- 0-D Tensor: scalar
- 1-D Tensor: vector
- 2-D Tensor: matrix
- 3-D Tensor: collection of matrices
- ~~High~~ Higher-D Tensor: Tensor with more than three dimensions.
